ABSTRACT

PROBLEM TO BE SOLVED: To provide a control system and a control method capable of accurately estimating a maintenance time before the deterioration of performance and abnormality of a heat source machine for an **air conditioner** occurs.

SOLUTION: A **heat source device** control method or a maintenance service are provided to **monitor** the operating condition of the **heat source machine 101** for an **air conditioner** with a central **monitor device 10** connected through an information communication **network** and to diagnose progress of the deterioration of performance and degree of abnormality by analyzing the operation data of the heat source machine 101 and to reduce a loss of a **user 100** due to the deterioration of performance and a stop of the heat source machine 101 by a failure. Furthermore, a remote concentrated control method is provided to grasp a load to be applied to the heat source machine 101 with the central monitor device 10 and to restrict the operation cost to the minimum.

ABSTRACT

PROBLEM TO BE SOLVED: To peel off waste materials sticking and growing on the inner peripheral face of a drum, by providing a cover body equipped with electric heaters in the inside at the outer peripheral face of the drum of a dryer for regenerating waste materials and applying current to the heaters while controlling it.

SOLUTION: Waste materials fed from a feed chute 11 for waste materials into a drum 3 are forced to contact hot air passing through the drum while tumbling and flowing down in the drum and heated up to a required temperature and discharged from waste material-discharge opening 12 at the lower part of a cold hopper 9. The stuck condition of the materials at the inner peripheral face of the drum 3 is **monitored** during the **heating** operation of the dryer. When it is judged that much waste has stuck to the drum, electric current is applied to the electric heater 15 in the cover body provided at the outer peripheral face of the drum by controlling a switch of an electric power supply device 16. In this way, the outer peripheral wall is heated by the radiant heat of the electric heater 15. The heat transfers to the waste materials stuck to the inner peripheral part through the drum wall to heat the materials at an appropriate temperature and melt asphalt components and decrease the viscosity to peel off the materials.

ABSTRACT

PURPOSE: To automatically discriminate the kind of food in a range of some extent and to improve rapidity of operation by a method wherein a size detecting means to detect the size of a food is provided, and high frequency heating cooking is controlled under predetermined a heating condition classified by a food discriminated by a kind of food discriminating means.

CONSTITUTION: A kind of a food intended to be automatically discriminated consists of five kinds divided into five categories of, for example, A, B1,

B2, C1, and C2, and a standard output intrinsic to each food is provided. When there is no need to defreeze a food on a turn table 4, after the starting of **heating** operation, the temperature rise gradient is **monitored** by a control circuit 13, and it is decided whether a temperature gradient is below a predetermined set value $\alpha.1$. In the case of a food having a high moisture content, it is decided that the food belongs to the category B. The control circuit 13 receives a detecting signal from an infrared ray sensor 8 to decide the size of a food. When the size is small, the category B1 corresponding to milk is selected, and when it is large, the category B2 to which a stew belongs is selected. When it is decided that the temperature gradient exceeds $\alpha.1$, the food is discriminated as a food having a less moisture content belonging to the categories C1 and C2.

Abstract (Basic): US 20040244390 A1

NOVELTY - A processor (32) connected to the sense-wire (26) wound on the core (24) surrounding the wire of circuit breaker, monitors the phase relationship between an alternating current (AC) voltage and AC current of an appliance connected to circuit breaker. Based on the phase relationship, information relating to the function of the appliance is determined.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) a method for remotely detecting functionality of an appliance; and

(2) device for monitoring a set of appliances.

USE - For remotely **monitoring** functionality of **electronic appliance** such as central **air conditioning** system, washing machine and refrigerator in residential, commercial or industrial establishment, over internet.

ADVANTAGE - The functionality and operation of the appliances can be efficiently monitored by the **user** from a remote location while avoiding superimposed signals due to simultaneous operation of more than one appliance on a circuit. The overall cost of the monitoring system is reduced considerably as the processor can monitor multiple appliances.

DESCRIPTION OF DRAWING(S) - The figure shows a schematic view of

appliance monitoring system.

Abstract (Basic): DE 102004028330A1

NOVELTY - Central control system for an air conditioning system that comprises a number of air conditioning **units** (100) installed in separate rooms of a building and a central control **unit** (200) that is connected to the **air conditioning units** over a **network** for **monitoring** and control purposes. The **individual air conditioning units** are controlled by the central control **unit** according to a timetable so that the total peak power consumption of the air conditioning units lies beneath a reference value.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is made for a method for operating the central control system of air conditioning system comprising a number of **individual** air conditioning units.

USE - Operation of the central control system of air conditioning system comprising a number of **individual** air conditioning units.

ADVANTAGE - The inventive control system prevents switching off of the whole air conditioning system, improves its stability and reduces power costs.

DESCRIPTION OF DRAWING(S) - (Drawing includes non-English language text). The figure shows a block diagram illustrating the configuration of an inventive control system for an air conditioning system.

Abstract (Basic): US 20040099404 A1

NOVELTY - The mechanism has a conduction device to conduct heat from a heat generating unit to a heat sink (154). The heat sink is disposed about a peripheral dimension of a convection device (134). The heat sink spans between about eight to two hundred degrees of the peripheral dimension. The convection device draws air through the sides and forces air radially outward across the heat sink.

USE - Used for **cooling electronic device** e.g. laptop computer, desktop computer, television, computer **monitor**, digital video disc player, **personal** digital assistant, cell phone.

ADVANTAGE - The heat sink is disposed about the peripheral dimension of the convection device, thereby forming a unitary device, thus occupying a minimal amount of space within the electronic device, and also minimizes the sound.

DESCRIPTION OF DRAWING(S) - The drawing shows a cooling mechanism.

JP 2003229969	A		13	H04M-011/00	

Abstract (Basic): JP 2003229969 A

NOVELTY - A controller (4) converts image data received from image pick up units (6A-C) which are monitoring respective controlled devices (5A-C), into display information and provides display information to a communication terminal (3) e.g. mobile telephone, through network (1). The controller converts command information received from communication terminal into control data for controlling the controlled devices.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for controller in remote control system.

USE - For controlling remote devices such as air conditioner, electrically driven door and lighting system using command information received from communication terminals such as mobile telephone and **personal** digital assistant (PDA) through network.

ADVANTAGE - Allows a **user** to easily and directly confirm the status of controlled devices installed in a house, using the communication terminal.

DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of the remote control system. (Drawing includes non- English language text).

public telecommunication network (1)
communication terminal (3)
controller (4)

Abstract (Basic): DE 20308158 U1

NOVELTY - The liquid cooling system has several liquid cooling units (4) in a rack (2) or cabinet and associated with individual electronic units (1) and a monitoring and control device (9) for monitoring the cooling temperature. The cooling units are connected via branch points (5.1) to a common central liquid cooling system (5) integrated into the rack or cabinet.

USE - For cooling electronic units.

ADVANTAGE - Enables reliable cooling of densely packed racks or cabinets with electronic units with high heat generation levels and prevents thermal damage to the electronic units.

DESCRIPTION OF DRAWING(S) - The drawing shows a schematic representation of an inventive arrangement

Abstract (Basic): KR 2003024449 A

NOVELTY - A method and a device for monitoring an air conditioner on the Internet are provided to control and manage the air conditioner at remote place by using the Internet management information of a web page, and to enhance convenience and efficiency for operating the air conditioner while preventing unnecessary operation.

DETAILED DESCRIPTION - A display(50a) for providing data to a user is installed to an exterior of the air conditioner. A controller controls the operation by receiving the operation control data from the web page(10a) through the Internet and downloads the display data through the Internet. A data storage(50c) stores the data including the data for controlling the air conditioner and the display data provided from the web page(10a). An internal timer(50d) operates regularly in order to control the time according to an operation state of the air conditioner. An Internet operating program(40a) connects the air conditioner with the web page(10a) through the Internet.

US 6430944	B1		11 F25B-001/00	

Abstract (Basic): US 6430944 B1

NOVELTY - The evaporation temperature of a refrigerant gas in the refrigeration **unit** (10) and the temperature of the atmosphere, **cooling** medium and the condensing refrigerant are detected and periodically transmitted to a **monitoring** and maintenance **server** through the **Internet** . A remote site **personnel** is contacted, if the

evaporation temperature falls below a preset level at a predefined atmospheric temperature.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for remote refrigeration unit monitoring system.

USE - For monitoring refrigeration units or chiller units installed at a remote site such as factory, automobile, to detect refrigerant gas leak or refrigerant insufficiency through the Internet, intranet, telephone lines, etc.

ADVANTAGE - By using the relationship between the evaporation temperature, atmospheric temperature, cooling medium temperature and the refrigerant condensing temperature, the leakage of the refrigerant gas can be efficiently detected in a reliable, simple and cost effective manner.

DESCRIPTION OF DRAWING(S) - The figure shows an external view of the chiller unit installed in a remote factory.

Abstract (Basic): KR 2002001090 A

NOVELTY - A system and a method for managing house are provided to confirm and cope with door/window locking, fire and gas leakage by using the Internet at a remote place, and control indoor house environment at a remote place at a low cost.

DETAILED DESCRIPTION - The first sensors(30,31,32,33,34,35) sense residential environment of indoor and outdoor house. The second sensors such as mikes(1,1A) sense sound of indoor/outdoor part and the second sensors such as cameras(2,2A) take photographs of indoor/outdoor part. A locking **device** (3) locks doors and windows. Peripheral equipment includes a gas cock-locking **device** (4), an air-conditioning and **heating unit** (5), a cleaning robot(6), and a lighting apparatus(7). A main **server** (10) **monitors** environment of indoor and outdoor house transmitting messages to a monitoring **unit** and transmits various information to a PC to which a **client** connects. A **personal** PC(10) connects to the main server(10) at a remote place for monitoring environment of the house and controlling environment of the house at the same time.

Abstract (Basic): EP 1196003 A2

NOVELTY - A HVAC device (14) is queried for status information on
regular basis or when a request is received from user terminal such
as handheld computed or cell phone, by a server (12). The server sends
the status information received from the HVAC device and an alarm
message to the user terminal.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for
HVAC device monitoring and controlling method.

USE - For monitoring and controlling heating , ventilation, air
conditioning (HVAC) device through the internet and GSM network

ADVANTAGE - Enables users such as owner, service technician,
building supervisor to obtain diagnostic information and receive alarm
messages about HVAC devices, easily. The HVAC devices are monitored and
controlled easily.

AU 200147422	A			G06F-009/44	Based on patent WO 200169380
--------------	---	--	--	-------------	------------------------------

Abstract (Basic): WO 200169380 A2

NOVELTY - An adaptation object defining an adaptation rule is generated based on a **user** characteristic included in an identified preference object. The contents of capability objects is transmitted to an adaptation engine (162). The **user** characteristics comprises situational, environmental, behavior and context information. The capability objects define attributes of an electronic device and of an accessed information source (166).

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (a) Adaptation engine;
- (b) Adaptation object;
- (c) Predefined interface adaptation system;
- (d) Adaptation object generation method;
- (e) Program storage device;
- (f) Preference object;
- (g) Preference object generation method;
- (h) Preference object generation system;
- (i) Capability object;
- (j) Capability object generation method;
- (k) Capability object generation system

USE - For adaptation of predefined interfaces in electronic **devices** such as computer, **personal appliance**, automatic teller machine (ATM), kiosk, portable **devices**, smart **appliance**, **network devices**, game system, **electronic** instrumentation, vehicles, television, lamps, **air - conditioners**, sprinklers, lifts, **monitoring** and control system with information technology systems and **devices** using information sources including databases, information bases, registries, repositories and other storage facilities, applications, agents, websites, Internet service providers, application service providers, chatrooms, collaboration and conferencing device and device drivers, adaptation and conversion services in assistive technology for

military command post and for handicapped individuals .

ADVANTAGE - Conveys the **user** preference and capability to an adaptation service, thereby providing desired communication process. Protects the preferences and capabilities of the **user** through authorization, thereby providing privacy and security. Handles various levels of complexity provided by **user** characteristic and capability objects efficiently. Provides explicit negotiation by defining several attributes through **user** characteristics and capability objects.

DESCRIPTION OF DRAWING(S) - The figure shows the block diagram illustration of an adaptation system.

Abstract (Basic): WO 200177853 A1

NOVELTY - An IP center unit (2) coupled to Internet, is installed in a subscriber's premises (1). When a device (3) in the premises is activated, the center unit determines the kind of communication requested and connects to a master-server (6) to find out if the

addressee is a subscriber or not. If the addressee is a subscriber, the center unit directly connects to addressee local unit, else establishes communication using Internet/other facilities.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for end-to-end communication establishing system.

USE - For providing **personal** /small-office-home-office (SOHO) services such as web hosting, video and other Internet services that emanate from having a server at the end **user** 's premises and provides remote control of **electronic appliances** e.g. **air conditioner** ; coffee machine for **monitoring** and metering them.

ADVANTAGE - Communication requested by the subscriber or non-subscriber anywhere on the globe is directly established, by any of the communication devices, without any carriers' exchanges.

DESCRIPTION OF DRAWING(S) - The figure shows the end-to-end communication establishing system.

Subscriber's premises (1)

IP center unit (2)

Device (3)

Internet (5)

Master-server (6)

Abstract (Basic): JP 2001236116 A

NOVELTY - A monitoring apparatus (2) is connected to the **customer** site gas apparatus (1) through a public communication network (P). An Internet television (5) at the **customer** site downloads data from a management server (6) which stores the monitoring data received from the monitoring apparatus through Internet (I).

USE - To **monitor** gas leakage in gas **appliance** such as **air conditioner** , drier through communication **network** such as **Internet** .

ADVANTAGE - The situation of the gas appliance is always made known

to the **customer** through a communication network, hence communication gas leakage situation is reported quickly and easily for devising a counter measure.

DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of the gas control system. (Drawing includes non-English language text).

Abstract (Basic): JP 2001203824 A

NOVELTY - The **member** information of terminal equipments (4a,4b) connected to a center terminal (1) through a network (3), is stored in a memory (9). A number generator (8) adds 0' at the leading end of the telephone number of the center terminal, if the number corresponds with the information stored in the memory.

USE - For transmitting telegraphic messages through **network** for **monitoring** installation apparatus e.g. **air - conditioner** , illumination apparatus, for inspecting gas meter, water-pipe meter, electric-power meter from remote management **device** , gas leakage.

ADVANTAGE - Normal communication with center terminal can be performed, even if the contract of **members** network is changed on the way. The information in memory can be changed before response telegraphic message transmission to center terminal, even if the message from the center terminal is not a setting demand message.

DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of network control unit. (Drawing includes non-English language text).

Abstract (Basic): WO 200144889 A2

NOVELTY - An on-demand web server (22) located remotely from tapping web server (30), provides information about remote device to web server (30) which accesses that information. The server (22) is accessed after wake-up connection from server (30), in response to request from client (10). The client transmits authentication

information to server (30) to initiate request to access the server (22).

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (a) Method for accessing information from remote device;
- (b) Apparatus for providing remote data access over internet;
- (c) Method to respond to **user** initiated request for accessing local information;

(d) Computer program

USE - For **monitoring** and accessing remote **devices** from office terminal e.g. for **internet** -enabled **cooling** or boiler water treatment control, waste water treatment **monitoring** and control, through **internet**.

ADVANTAGE - Since remote web server is connected with on-demand web server using standard web browser, authorized internet **users** can access on-demand web server without customized software.

DESCRIPTION OF DRAWING(S) - The figure shows the diagram depicting information exchanged between **client** and servers.

NOVELTY - The operation of appliance (20) is controlled by numeric key pad (24) with alphabetical characters to display web page with relevant link identifying by number. Input device has **user** actuatable control with number corresponding to each link on web page. The pad has IR signal transmitter. The web page has several links such that each link is reselected by pressing single numeric key pad control.

USE - For controlling operation of domestic electrical **appliances** like TV, refrigerator, kitchen range **air conditioner** and remote door/room **monitoring** system connected to **internet**.

ADVANTAGE - Facilitates returning to the original operation mode even when operation is switched to other modes, thereby reduces switching time.

DESCRIPTION OF DRAWING(S) - The figure shows the pictorial view of multimode electrical appliance.

Abstract (Basic): JP 10275033 A

The method involves monitoring internal temperature of an electronic device or a specific circuit in the device by a microprocessor. When the monitored temperature exceeds a fixed temperature, a predetermined cooling process is provided inside the device or the specific circuit.

Preferably, a predetermined temperature management is performed based on each temperature condition inside electronic device or specific circuit in the device during ON and OFF states of power supply.

ADVANTAGE - Ensures stable and reliable operation of electronic device. Ensures safe operation of electronic device.

					CIP of patent US 5429178

Abstract (Basic): US 5590706 A

The sensing device for use with a heat exchanger for use with a utility service water system has a heat exchanger having a shell side and a tube side. A tube sheet provides a heat exchange surface between a coolant fluid zone and service water zone comprising **individual** heat transfer tubes extending between an inlet header for separately introducing service water and coolant fluid into the heat exchanger. A discharge header separately extracts exhaust service water and coolant fluid. A tube monitors flow and has at least one heat transfer tube providing a fluid flow conduit. A tube monitors temp. including at least one plugged heat transfer tube positioned immediately adjacent the device for monitoring flow.

A combination device **individually** senses flow in the fluid flow conduit in combination with sensing temp. differentials in the plugged heat transfer tube, and has a dual tube and plug appts. connected to a discharge end of the tube device for monitoring flow adjacent the discharge header and a discharge end of the tube device for monitoring temp. also adjacent the discharge header. The dual tube and plug device has a flow sensing device including a first flow assembly tube including a tubular conduit, and a flow sensor mounted in an inner chamber for directly measuring the coolant flow through the dual tube and a plug attachment for connection with the temp. monitoring tube. A second temp. assembly tube is configured to plug the outlet of the temp. monitoring tube, for excluding coolant flow, immediately adjacent to the first flow assembly tube. A sensor detects shell side inlet water temp. and shell side outlet water temp. A device senses tube side inlet water temperature and tube side outlet water temp. A device seals out coolant flow comprising at least one plug devices for attachment to the inlet end of the temp. monitoring tube. A monitor compares temp. differential signals and flow signals from the dual tube probe and plug unit's first dual tube probe and plug assembly and combines other flow and discharge temp. signals from additional dual tube devices connected to a microprocessor. A microprocessor utilises flow and temp. differential data provided by the flow sensor and the temp. sensor and continuously calculates, records and displays the **individual** tube heat transfer coefft. and flow velocity for the selected heat transfer tube.

ADVANTAGE - Provides accurate measurement of temp. and cooling water flow. Provides indication of performance losses due to micro-bio fouling of heat exchanger surfaces.

DE 3314216	A		44		

Abstract (Basic): DE 3314216 A

The regulating system can be applied where electrical loads drawing power from the engine can have an appreciable effect on engine power demand. Such loads may be headlamps, an **air conditioner**, a **cooling fan**, or any such combination. The engine demand and performance are **monitored** by an **electronic control unit** which orders the fuel quantity to be delivered by the injectors.

It also detects the addition of an electrical load or combination of loads and adjusts the auxiliary air inlet valve to allow a predetermined amount of air to flow into the manifold downstream of the throttle valve. This action enables the engine to deliver the extra power demanded without a change in the throttle setting. A closed loop speed controller can be employed to respond to electrical loads when the engine would otherwise be idling with the throttle closed.

0/8

Title Terms: SPEED; REGULATE; MOTOR; VEHICLE; ENGINE; AUXILIARY; CONTROL; AIR; INLET; COMPENSATE; ADD; ELECTRIC; LOAD

Derwent Class: Q52; X22

International Patent Class (Additional): F02D-011/10; F02D-033/02;

F02D-041/04; F02M-023/04; G05D-013/62

File Segment: EPI; EngPI
